1. e industrial bioprocesses, by which useful molecules or products can be produced, including organic acids, alcohols, sugars, amino acids, and fatty acids. 2. e present invention relates to the industrial applications of microorganisms and their enzymes, which are already well-known in the art, 3. e purpose of the present invention is to produce valuable industrial chemicals by enzymatic actions, such as fermentation and biocatalysis. 4. e available biochemical methods have many disadvantages, such as the slow speed of the catalytic reaction, 5. e non-selectivity of the reaction, and short life of the catalyst, with other adverse consequences such as high production costs. 6. e field of industrial microbiology involves a thorough knowledge of the microbial physiology behind the processes in bioprocesses, by which useful molecules or products can be produced, such as organic acids, alcohols, sugars, amino acids, and fatty acids. 3. e present invention relates to the industrial applications of microorganisms and their enzymes, which are already well-known in the art, 4. e purpose of the present invention is to produce valuable industrial chemicals by enzymatic actions, such as fermentation and biocatalysis. 5. e available biochemical methods have many disadvantages, such as the slow speed of the catalytic reaction, 6. e non-selectivity of the reaction, and short life of the catalyst, with other adverse consequences such as high production costs. 7. e present invention relates to novel biocatalysts, the application of which to biochemical reactions not only accelerates the reaction, but also provides a higher selectivity of the reaction, leading to a more efficient industrial use of microorganisms. 7. e present invention relates to novel biocatalysts, the application of which to biochemical reactions not only accelerates the reaction, but also provides a higher selectivity of the reaction, leading to a more efficient industrial use of microorganisms. 8. e present invention relates to the field of enzyme technology, which is already well-known in the art. 9. e present invention provides a method for the production of biodegradable polymers by catalytic degradation of biodegradable polymers, which polymers are a mixture of polyesters, polyamides, polysaccharides, and polyureas. 10. e present invention relates to the field of producing enzymes, which are a mixture of polyesterase, polyamidease, polysaccharidease, and polyurease. 11 82157476af
